In This Chapter Printing to a desktop printer Preparing your images for print Getting a handle on the interface Understanding Photoshop's tools Digitizing your images Understanding the choices you face Creating a document Printing and preparing your images Printing pages as booklets Any kind of photo editing means some degree of conversion from the original image to something that can be printed. In this chapter, you find out how to work with the standard desktop printer that came with your computer, but also learn how to prepare images for print so that they are ready to print. ## Print Your Photos The graphics department at your local drugstore, grocery store, or department store usually has a printer that can print to 4 x 6–inch standard printing paper. These printers are usually more than adequate to print photographs, and more and more software programs have printing capabilities built in that let you print directly from your computer. The computer printers designed for photo output make it easy to print photos, either in the traditional 4 x 6–inch format or in smaller or larger sizes. You can also print onto special materials or canvas, such as photographs that look like real museum art. ## Getting Your Photos Ready for Printing In this section, you discover how to prepare your photos for printing, whether you plan to print your images to a desktop or flatbed printer or to a photo printer that can print on canvas. You also find out about the various kinds of print paper that you can use.

Q: How to use data-ng-key inside angular $http GET? I am using the below code to get all the rows where a specific filter is applied. $http({ url: '/competitors/all', method: 'GET', params: {filter: rowFilter}, headers: {'Content-Type': 'application/json'} }).success(function(data) { console.log(data); $scope.competitors = data; }).error(function(data) { console.log(data); $scope.error = "Please select a competitor"; }); With the code above, the link works when I type something in the filter field. But when I set the field to be data-ng-key, it doesn't work. It is showing "Please select a competitor". Is there any solution to this problem? A: You shouldn't use data-ng-key, it will cause flickering in the browser. All AngularJS HTML attributes do. Use ng-model instead. Q: Why do some sites now require a login to view an answer? I am currently working on a project that will be used to allow readers to connect to another website (allowing them to see that website's articles and interact with them) The problem I ran into was that it was not letting me access any of the articles on the website I would like to connect to if I was not logged into that website. So I began reading Stack Overflow's sources and I noticed that they log you into their website if you are not logged in yet (or if you have not visited the website for a while and wish to log in). Here is the line that I found that checks if the user is logged in and if not they force them to log in. if (Request.IsAuthenticated) { if (String.IsNullOrEmpty(loggedInUser) || (loggedInUser!= null && loggedInUser!= Request.LogonUserIdentity.Name)) {

Q: Best way to mimic asp.net login for iPhone SDK? I'm currently building an app which requires an authentication mechanism, and am aware of the use of the OpenID for my website, however OpenID is not available to iPhone apps on the app store at the moment. I have also seen that there are various third party libraries and libraries which may be able to fill the gap and mimic the functionality of the asp.net login control on the website, however I am not entirely sure whether they will work as the same would require the user to have a login ID and password supplied by the app on his iphone. Is there any other way I can provide the same functions that the asp.net login control has, or is the only way to fill the gap using the OpenID protocol for my app, or are there any other security mechanisms that could be used instead of OpenID? A: I believe an app that doesn't require a username and password would be possible, and it might be available on the App Store. If I remember correctly there was also an example app on the iTunes Dev site that implemented the login system I believe. I think it wouldn't be feasible for an app to automatically do what an ASP.NET login system does, and I'm sure you will be implementing additional authentication layers. # Changelog All notable changes to this project will be documented in this file.
