GFA-0133 - Improved Estimating, Planning and Scheduling With the introduction of AutoLISP in AutoCAD 2009, the AutoCAD functionality was no longer just limited to the command line and drawing editors. From an AutoCAD perspective, the AutoCAD shell was no longer just a mechanism to load a.DWG file and view it. It had evolved into an AutoLISP scripting environment in which AutoCAD could be scripted for more sophisticated functionality. AutoCAD is designed for the creation of a drawing using the command line, graphical user interface, or any combination of both. This method allows a user to create a design and to control the drawing process. One user interface provides commands for common tasks, such as drawing basic geometric figures and managing drafting components, while another provides commands for specialized activities such as managing master data. There is also a graphical interface, which has tools to perform similar tasks, and there are interfaces that access third-party software. Tools are also available to create and manipulate drawings from within AutoCAD. Some of these tools are more commonly associated with more powerful, non-AutoCAD applications. For example, an image editor can be used to merge two images to create a single image; AutoCAD does not have this capability. One tool that AutoCAD does include is a lister that can store information in a database and display it in a spreadsheet-like format.

AutoCAD provides the ability to compare two or more drawings. This capability was previously limited to comparing the current drawing with a previous drawing. However, AutoCAD now provides the ability to compare a number of drawings or a drawing with an image. In addition, AutoCAD provides a Compare option to compare two drawings. GFA-0194 - Reflection, Boundaries and More AutoCAD introduced a new command in AutoCAD 2006, "Label Object" or "Label Layer". This command is only applicable for objects that are closed and does not have any style applied. AutoCAD labels all objects without style and is used for the purpose of assigning a name to the objects, which can later be used in various operations. In 2007 AutoCAD released the Parametric Segment Labeler (PSL) with new features. The PSL is a third-party plugin for AutoCAD, which adds many advanced features to the Label Layer.
