Parametric modeling is the ability to create a new model by drawing curves, surfaces, and other geometric objects into a drawing. These models can then be placed on any plane in the drawing, freely rotated, and viewed from any angle. Any object that is defined with parametric modeling includes the ability to freely scale the object as a solid geometric entity. For example, if you draw an H shape, you can later resize the whole shape or just the left and right sides of the H to be much larger or smaller. Other aspects of parametric modeling include mirroring, defining a single profile for an extruded or forged edge, and automatically generating the correct toolpath for the process used to create the edge. You can use the design software to determine the length of the edge, the bevel angle, or the radius of the corner. The software

can then generate the correct toolpath that can be used to cut the correct size of the bevel from the block of material used to make the object. To set up the parametric modeling process, the user defines the desired object by using the TIN tool in the drawing.

This tool creates the desired geometry as a series of line segments, as shown in the illustration below. The user then creates a curve defining the desired profile. For example, you can use the tool to extrude the geometric shape into the drawing, or generate a series of edge loops defining the edge. Any shape that is parametrically defined includes the ability to freely rotate. You can rotate the object in any direction, adjusting the angle by using the scaling tools in the software. In the illustration above, the X, Y, and Z scaling handles are on the drawing canvas, while the Origin scaling handle is on the right side of the drawing. When you create an object using parametric modeling, you can also adjust the object with the Shift key. For example, you can easily change the scale of an object by moving the shift key to the right. This also enables you to adjust the location of the object in the drawing space by moving the Shift key to the left. AutoCAD uses several coordinate
