Everyone is talking about climate change right now, and this is kind of obvious. The question is, what can we do about it? Every month seems to bring a new report on the subject. But what if I told you that you could easily make a difference right now? For years, I've been talking about the lack of articles on "Save the Climate" that focus on the simplicity of the solution, and how to implement it. There is so much hype out there today that is focused on "how to make money from it", or "how to scare people", or "how to win elections", or "how to get a bunch of billionaires to give you money." But as much as I enjoy those stories, I really only care about how to save our planet. And the solution is simple. If you are reading this, you are not far enough along the line to see this, but here it is: we only have one planet, and our current practices are killing us. So I wanted to talk to you about the one thing we can do. We have the exact same power that has killed off entire species in the past. When I was a child, I remember the WWII movies we watched would often show the story of the "A-Bomb" that was being researched in a lab and how it was quite literally the biggest thing to ever be created on earth. It was a symbol of our own power and our potential to create things of massive destruction. However, this exact same technology is the force that will save our world. We are developing a set of technologies that will be able to create clean sustainable power. The revolution is happening right now, and if we come together, we will have this available within the next decade. You can hear me talk about the power of the A-bomb and the power of nuclear here on my radio show here. In the meantime, we have to make a1d647c40b
