Abbottobius taipei *Abbottobius taipei* is a species of walking stick insect in the family Diaperidae. It was first described by Yoshiyuki Okamoto in 1999, from specimens collected in the vicinity of Taipei in Taiwan. The species is the first member of the genus *Abbottobius* to be found in the Greater Mekong Subregion. References

Category:Phasmatodea genera Category:Insects described in 1999

Category:Insects of TaiwanThe Ducks will not play this week as expected, with varsity play cancelled for both boys and girls due to the onset of winter weather. Updates will be posted as soon as they become available.

In addition to varsity play, safety prohibits most middle school play as well. Head Coach Matt Coppolino's policy on soccer is unclear at this time, but the sport will not be played either and updates will be posted as soon as they become available. Do not fret if your child's team is not playing on Saturday, it may be played in the future. At this time the schedules have not been released for the fall season.

Temporal decomposition of the temporal derivative of muscle force in a bimanual task. Temporal decomposition of the time course of muscle force reflects the neural control mechanism for muscle force. In this study, we analysed the temporal decomposition in a bimanual task using an adaptive linear model. The proposed model can estimate the effects of the onset delay and the onset delay changes in each muscle in each trial as latent

variables. The ratio of the effects of the onset delay and those of the onset delay change were similar for each muscle in each trial, irrespective of arm dominance. The result shows that the temporal decomposition of muscle force does not require arm dominance or an assumption that the onset delay of muscle force in a bimanual task is constant. This implies that the neural control mechanism is similar in the bimanual task and in the unimanual task.
