If you have a $n\times n$ matrix A, then the eigenvalues are the roots to the characteristic equation. Recall λ is a root iff $A-\lambda I$ has nontrivial nullspace, and therefore $\det(A-\lambda I)=0$. Then one should have that $\det(A)=\det(A-\lambda I)$. However, I don't understand how the author implicitly sets up the problem. When I tried it myself, this is what I did: $$\det(A-\lambda I) = \sum_{i=0}^n(-1)^i {n\choose i} \lambda^i=\det(A)$$ and from there I don't know what to do. I also know that if you have an alternative way of solving the problem, you can give that as well. A: I can think of two ways to do this. $\lambda_1,\dots,\lambda_n$ are the eigenvalues of A and I is the $n\times n$ identity matrix. $\lambda_1,\dots,\lambda_n,1,\dots,1$ are the eigenvalues of $B=A-I$ and B^n is a matrix whose only non-zero element is a 1 in the 1-th row. A: I also know that if you have an alternative way of solving the
