Q: Can't find.cubasedb.sqlite when running from bash on Mac I'm running MacOS Mojave (10.14.2). I've built, but not installed, a large application using GNU Make. On the build process the application is configured to write to a.cubasedb.sqlite file. When I run the binary on MacOS, it appears to run successfully, but when I look in the folder the.sqlite file that is supposed to be there isn't there, and neither is anything that indicates that the bin can write to a sqlite database. I've also tried running the application using the bash script in the Makefile, but that does not run successfully. No.cubasedb.sqlite file shows up anywhere. What I did to run it successfully was manually copy the.sqlite file to the target folder. So the question is: is this behavior what's expected when using GNU Make to build an application that uses.cubasedb.sqlite on MacOS? Should the.sqlite file appear in the same place as the executable? A: The answer to the question is that this behavior is as expected. The build process will be configured to put the.sqlite file in the same place as the executable. This invention relates generally to the field of fuser members, and in particular to an improved release fluid coated fuser member and a method for preparing the same. In typical electrostatographic reproducing apparatus (such as copiers, printers, facsimile machines, or the like), a light image of an original to be copied is recorded in the form of an electrostatic latent image upon a photosensitive member or an electrostatic recording medium. The latent image is subsequently rendered visible by the application of electroscopic thermoplastic resin particles which are commonly referred to as toner. The visible toner image is then in a loose powdered form and is usually transferred from the photosensitive member to a copy sheet, which is then passed through a fusing apparatus where the toner image is affixed to the copy sheet. The fusing process may include a cross-roller fuser, in which the unfused toner image is passed between a pair of fuser rollers including at least one fuser roller and a backup roller to affix the image to the copy sheet. Alternatively, the fuser member may be a belt member in which the unfused toner image is passed between the fuser belt and the backup roller. The belt fusers can be either a dry belt system in which there is no application of heat to the toner image, or a liquid release fuser (also known as a fusing belt system) in which the belt is heated to facilitate the release of the toner from the belt. As an example of an apparatus in which fusing is accomplished by passing the unfused toner image between a fuser member and a backup member, U.S. Pat. No. 4,600,788, the disclosure of which is incorporated herein by reference, discloses a fuser member comprised of a solid core member having a fusing surface layer thereon, and a thin pressure sensitive release fluid layer in contact with the fusing surface layer. The release fluid layer includes a mixture of polymers and a release fluid such as silicone oil. Typically, silicone oils have been preferred for use as release fluids, since silicone oils have a relatively low surface energy and provide fusers with a high degree of release. It is preferable that the release fluid be able to freely migrate to the surface of the pressure sensitive adhesive layer so as to form a barrier between the release fluid and the toner. A fuser member comprised of a solid core member having a fusing surface layer applied thereto has
