Q: calculating number of combinations from a list of data In my program i want to calculate the no. of combination of an item list which is a list of several parameters. eg, if my list is "3,7,8" then no of combinations will be  $3 \times 7 \times 8$ . So, the no of combinations is the product of all the items in the list. I want to iterate over the list and want to have an output with each combination and the count of each combination. eg, for combo in zip(('3,7,8', '4,6,7', '5,6,8'), range(1,4)): print(count(combo)) This will give me all the combinations  $3 \times 7 \times 8$ ,  $4 \times 6 \times 7$ , and  $5 \times 6 \times 8$ . But i am struggling to figure out how to iterate over the list of data and calculate the count of each combination. This is what i have been doing.

```
import itertools
counts = []
for i in range(1,4):
    for j in range(1,len(list)):
        counts.append(i*j)
```

This gives me a list of all the combinations and how many of each combination. But I am not getting the number of each combination. Is there any other way to do it? A: This should work (for the combinations you provided):

```
from itertools import combinations
combinations(list("3,7,8"), 3) or
from itertools import combinations
combinations(list("3,7,8"), 3)
```

You could do it in a one-liner like this:

```
from itertools import combinations
a, b, c = [1,2,3]
print([[list(c)]*len(a) for c in combinations(list("3,7,8"), 3)])
```
