Field of the Invention The present invention relates to a recording medium having an information recording area with a higher degree of recording density than the average recording density. 2. Description of the Related Art A recording medium such as an optical disk, a magneto-optical disk, an optical card and a magnetic card is provided with recording areas each corresponding to a predetermined recording density on the entire medium surface. An area with a higher density recording than the average recording density is called a recording area having a high recording density. In general, a recording area with a high density is used as an area where moving picture data, still picture data or voice data is recorded (refer to, for example, International Publication WO 94/26690). As a method of increasing the recording capacity of a recording area, a method is employed in which recording conditions such as the laser power, the recording pulse width and the rotating speed of a disk is set to a predetermined value, a signal having a linear velocity higher than the prescribed value is recorded as a pre-groove track, and the track pitch is reduced by reducing the track width of the pre-groove track so as to reduce the track density in the vicinity of the pre-groove track (refer to, for example, Japanese Patent L e79caf774b

Need help solving this problem. I would like to know the steps of the problem and also any hints. Numerical methods for solving the problem can be roughly broken down into numerical methods for finding an error of a numerical solution as opposed to finding an exact solution. The following is a brief list of the items. I have an assignment in which I'm to solve a pde. I have had a look at this website and I have some problems to really understand it. I have uploaded a screenshot of the assignment. If you have any questions or need more info. Please feel free to ask. Trying to fix this long winded question. First part is the function f=sin(2t), x = (cos(2t), cos(2t). The sketch I have to do has the following values, h=1, x = (1,1). The function I am to find is, a?=?y - f(x)? When I solve the PDE using the method of characteristics it gives x?=?y as the solution, which I believe is correct. I am facing a problem while using the method of characteristics to solve the pde. The method of characteristics gives me the equation of the characteristics as, where m is the slope of the x axis. But in the book they are given as, while using the method of characteristics for finding the solutions
