FoxM1 is a member of the Fox transcription factor family, and displays a specific expression pattern during the development of mouse embryos. FoxM1 encodes a highly conserved Forkhead box transcription factor consisting of a transcriptional activation domain, a Forkhead box domain and a nuclear localization sequence. FoxM1 is expressed in the developing embryo, the placenta and the germ line. In embryonal carcinoma cells, the Forkhead box domain is sufficient for FoxM1 transcriptional activation, whereas in the placenta the Forkhead box domain is not sufficient for transcriptional activation and requires a large activation domain. Expression of FoxM1 is growth regulated and is lost during growth arrest. FoxM1 controls the expression of genes, e.g., CCNB1, CDC20 and PTTG1, involved in G2/M and M/G1 phase progression. In addition, FoxM1 regulates the expression of a number of important genes in a p53-dependent manner. The expression pattern of FoxM1 resembles that of FoxM2, another member of the Forkhead family of proteins. FoxM2 has been shown to stimulate the cell cycle of the early embryo as well as the proliferation of placental cells. However, the mechanism by which FoxM1 regulates gene expression is different from that used by FoxM2. Finally, FoxM1 and FoxM2 interact with each other and each other's antagonists in the placenta. Thus, FoxM1 and FoxM2 have distinct functions, despite the common expression pattern of the two proteins. course, of the offense of engaging in organized criminal activity. Q: PowerShell: Assign Variable to Desired Path from a List I have a script which has a parameter which specifies the folder where the list of files which are to be extracted are. \$Folder = "D:\Scripts\Test" Get-ChildItem \$Folder | select Name, LastWriteTime, Length, @{L= {"Size";"Bytes";"MB/s"}} To run this script is something like this: .\myscript.ps1 -Folder "D:\Scripts\Test\FileName" How do I script this parameter to be something like \$Folder = "D:\Scripts\Test" Get-ChildItem \$Folder | select Name, LastWriteTime, Length, @{L= {"Size";"Bytes";"MB/s"}} so that I can be able to run the script either like .\myscript.ps1 -Folder "D:\Scripts\Test\FileName" Or .\myscript.ps1 -Folder "D:\Scripts\Test\SomeOtherFolder\FileName" ? I guess this can be achieved by running some command line script and then passing it the path to the file which is passed in \$Folder parameter. I was hoping to avoid the same but creating the entire script from the command line with "PowerShell.exe" is kind of too complicated. If there is no alternative to what I want to achieve, I will need to do that after all. A: If you want to re-run from script, I would just write a simple script or function to do it for you. You might also check out Invoke-Expression or Invoke-Cliland to run a script from your script. The rates of prevalence of hypertension, diabetes, and obesity in the central African Republic. Small nucleolar RNA SNORA49 snoRNA U49 is a non-coding RNA molecule, found in plants and fungi. SNORA49 is a member of the H/ACA box class of snoRNAs that guide the sites of modification of uridines to pseudouridines. Pseudouridines are abundant in some small nuclear RNAs and in ribosomal RNAs, but not in others, and therefore their functions are unknown. U49 is unusual because it has a conserved YG(A)CAC motif (Y=C/U; G=G/U; A=A/C) in the D-box and unusual elements in its H/ACA-box. Do you want to buy a print?’ I didn’t know the artist. So I emailed her and said, ‘How much are these?’ She was like, ‘They’re not for sale.’ I said, ‘What do you mean they’re not for sale? You’ve been selling prints.’ And she said, ‘Yes, but we’re not going to sell them anymore.’” The result? “I got really upset,” Bruno said. “I told my dad, and he had to talk to my boss, and he said, ‘You know what? You can work as long as you want, but you
