WinFF

WinFF is a program that enables you to convert between several media formats, including AVI, MPEG, MOV, MKV, MP3, VOB and OGG. The user interface consists of a standard window in which you can add audio and video to the queue by using the file browser or the "drag and drop" method (batch conversion is supported). Thus, you can remove an item or clear the list, play an audio or video file, preview results and configure output details when it comes to the format, preset and location (you can optionally check the "Use Source Folder" option). Furthermore, if you click the "Options" button, several more tabs appear and they allow you to input manually the values for video bitrate, frame rate, size and aspect ratio, as well as audio bitrate, sample frequency rate, channels, volume, and synchronization. You can also crop a video file (by setting the top, bottom, left and right margins), go to a particular time to record it and set advanced command-line parameters. Additionally, you can import and edit presets, enable WinFF to shut down the computer after conversion, as well as configure program preferences (e.g. default destination directory, priority). The program uses a low-to-moderate amount of system resources and quickly completes a task while managing to keep a good image and audio quality. There's also user documentation with snapshots at your disposal. Too bad you cannot select predefined values to configure audio and video options, so you must have some experience to do this manually. Otherwise, we strongly recommend WinFF to all users.

WinFF Overexpression of sesquiterpene synthases of *Salvia miltiorrhiza* promotes cell proliferation. *Salvia miltiorrhiza*, a traditional Chinese herb, has been widely used in clinical and cosmetic applications due to its multiple health benefits, such as anti-aging, antioxidant, and antitumor properties. In the present study, SMERF1 and SMERF2 were selected from 30 candidate genes from two *S. miltiorrhiza* sesquiterpene synthases (SS) family to explore the biological role of sesquiterpene synthase. The recombinant SMERF1 and SMERF2 were expressed in *Escherichia coli* BL21 (DE3) and purified by Ni-nitrilotriacetic acid and gel filtration chromatography. SMERF

The audio equivalent of this process is known as DVD-Audio transcoding. Video/DVD transcoding may involve the same formats as video conversion, including the major video file formats and those used for streaming media such as MP4 and ASF, in addition to DVD formats. The term conversion is ambiguous, and so, many sources use different or imprecise terminology. Conversion may mean different things to different people, depending on context, which may make their definition of the term unclear. A "transcoding" process converts source material into a different form of the same content. Depending on the context, this may mean that the source and target material are of the same content (eg video and DVD format conversion), or that the source and target are of a different content (eg conversion of a movie file to MPEG-4). This process can also include all that is involved with the distribution of an encoded video file in different delivery formats or formats, and the encoding,
