What's New in the Encrypted?

Encrypted is a free and very easy to use tool designed to protect text documents, html files or just about

any kind of file. If you are looking for a strong encrypted solution you might want to consider Protected Disk. Introduction Encrypted is a free application providing you with a simple way to protect documents stored in your Computer or in the web. With an easy and intuitive interface you can easily protect any text document, plain html file, or even image files from anybody but you. The password protects your documents/files and you have full control over the files you wish to protect. Encrypted comes with a

large number of security options and algorithms that will satisfy even the most paranoid of users out there. It's also a perfect tool to implement if you're looking for a safer way of emailing files with the mainstream email client built-in.

Key Features Simple file protection Starting a protected file requires simply clicking the button or file. Encrypted displays the modal window shown in the screenshots, with two different levels of security options and algorithms: Open - having a

password is unnecessary but if you wish to keep it hidden for a specific purpose, not to mention you want to protect files from unauthorized use, enabling the open option will allow you to do so. Protected - this is where you choose how much security you want to provide your files. This level allows the most advanced users, with specific security settings and a custom master key. Protected with a password Encrypted offers two different modes of security, including

passwords: Protected with a password - this mode is the most simple, using a standard keypad to enter the password or other characters. Protected without a password - this mode is the most complete, Encrypted will ask you a password for certain files only. Enabling both options will allow you to protect/unprotect any files you desire. Using the files encrypted without a password is the preferred mode of use, since there is no need to enter a password every time. Encrypting files The

encryption algorithm used by Encrypted is based on a simple RSA algorithm, which is very efficient and comes without any known weaknesses. To encrypt files, simply use the folder in which you wish to store the files, and hit enter. The file will be decrypted and displayed for you to view. If you want to encrypt files outside the document folder, simply hit enter in the input field to automatically create a folder for your purposes. In order to
