Field of the Invention The invention relates to an electronic device and an operating method thereof, and more particularly, to an electronic device capable of providing protection from over-current and an operating method thereof. 2. Description of Related Art With advance of technology, various electronic devices have been developed to meet user's requirement. These electronic devices may be used to process data or audio/visual data. For example, a computer may be used to process data or audio/visual data. Due to the development of digital display technology, most electronic devices with digital display functions have an input voltage input for receiving a plug of a power source. An electronic device with digital display function may receive a power source to provide a display effect, and a display panel of the electronic device provides a display image for visual display. When the display panel of the electronic device receives a power source and the plug of the power source is inserted to the electronic device, the display panel may be activated and the display image may be displayed by the display panel. When the electronic device is in operation, the display panel may generate heat due to internal operation of the electronic device. If the heat is not dissipated effectively, the display image provided by the display panel may be distorted. Therefore, to dissipate heat produced by the display panel efficiently, a heat dissipation module is usually disposed in the electronic device to dissipate heat efficiently. However, when the electronic device is in operation, the power source may provide a full voltage, and the heat produced by the electronic device may over-dissipate. Therefore, the power source may have a protection function to prevent the electronic device from being damaged due to over-current. In practical application, the electronic device may only receive a power supply for operation in some situation. For example, when the electronic device receives a power supply via a cable, the power supply may not be a full voltage. Therefore, a current of the power supply may be limited to a normal level. Due to the above-mentioned situation, when the electronic device receives a full voltage via the power supply at a time that the electronic device is
